Reflection

Designing front end pages for our application required forethought to ensure we built an application that was user friendly. The majority of our time spent in the design process for these pages focused on user experience. We wanted to create an application that felt natural to navigate and allowed the user to perform their desired tasks in a straightforward way. Thinking critically about the end to end experience on the website helped us to create cohesive user interfaces. Security was also a focus that we have had while designing this application. Ensuring that we don't display users' passwords as they are typing them and only displaying non-user specific information before login helps to protect the PII of our customers.
